

Symphony in nature

The garden depicts the melodious accord existing in the naturally endowed Kenyan ecosystem. The echo of the breath taking Mount Kenya, the whistling of the giraffe, the tweeting of birds, the flowing stream and the rustling of the leaves create the perfect heavenly orchestra of nature which can only be experienced in Kenya.

The garden is a harmonious and symbiotic relation of nature. The bird needs the flower's pollen for protein and its nectar for energy. The bird, while collecting these sources, inadvertently brushes pollen from one flower to another to ensure the flower's reproduction process begins. The bird needs the flower to survive; the flower needs the bird to survive. These are positive sum relationships.

This harmonious and symbiotic relation is what humanity should strive to cultivate for prosperity. The human race needs to be at peace with the environment. Our uniqueness should blend to create that excellent symphony.
